140,040 POT

of staking rewards sits unclaimed on Portaldot mainnet. On Portaldot, a reward pays out only when someone sends the payout, and often nobody does.

Portaldot mainnet, block 2,746,423 · 28 Oct 2026 · estimate from the chain's payout formula · live: portalnode.timidan.xyz/mainnet/api/network

THE PROBLEM

Rewards on Portaldot don't pay themselves.

84 eras

then an unclaimed reward is gone for good

staking history depth, mainnet and V3

4 of 10

mainnet validators have claimed nothing in that window

every era 3,831–3,914 unpaid

2.78M POT

bonded to an inactive validator, earning nothing

7 nominator accounts

eras 3,831–3,914 · block 2,743,403 · amber expires this week · grey unclaimed · dark claimed

Claims Portaldot staking rewards before they expire, and tells operators when their node needs attention.

01 It sends the payouts

Real `payoutStakersByPage` transactions from a fee-only key, every era, settled only from finalized receipts.

02 Anyone can claim

Look up any validator or nominator on V3 or mainnet; one click opens the payout batch in Node Console for your own wallet.

03 Health on-chain

Each era a Solidity contract on V3 records every validator's paid-through era and liveness for any dApp to read.

Plus: liveness as pallet-im-online counts it, session-key checks, Telegram/Discord alerts with the fix, a setup wizard

Era 56: closed, paid and on-chain in 2 minutes 12 seconds.

13:54:06 UTC · block 204,108

Era 56 closes

`staking.EraPaid`

13:54:54 · block 204,115

Payout in a block +48 s

`payoutStakersByPage → staking.Rewarded`

13:55:36 · block 204,122

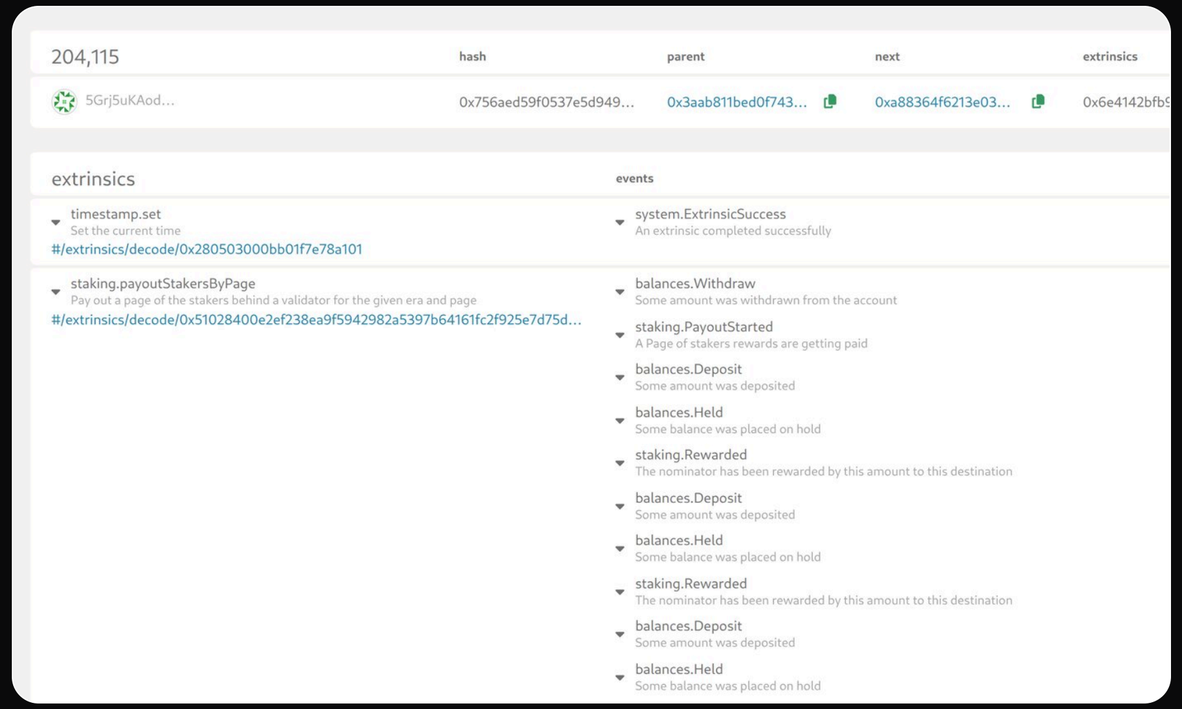

Second validator paid

`each receipt re-checked against its finalized block`

13:56:18 · block 204,129

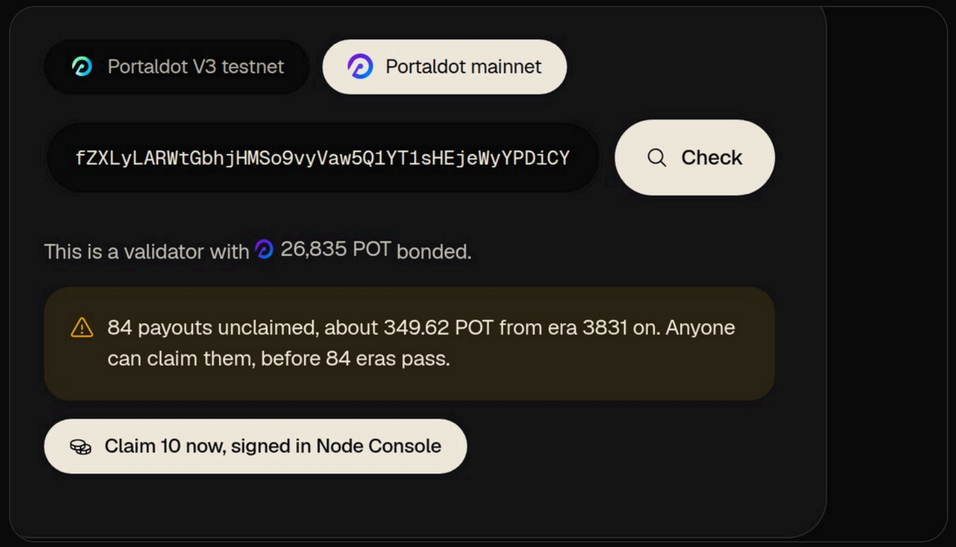

Contract updated

`revive.call → statusOf = era 57, paid through 56`

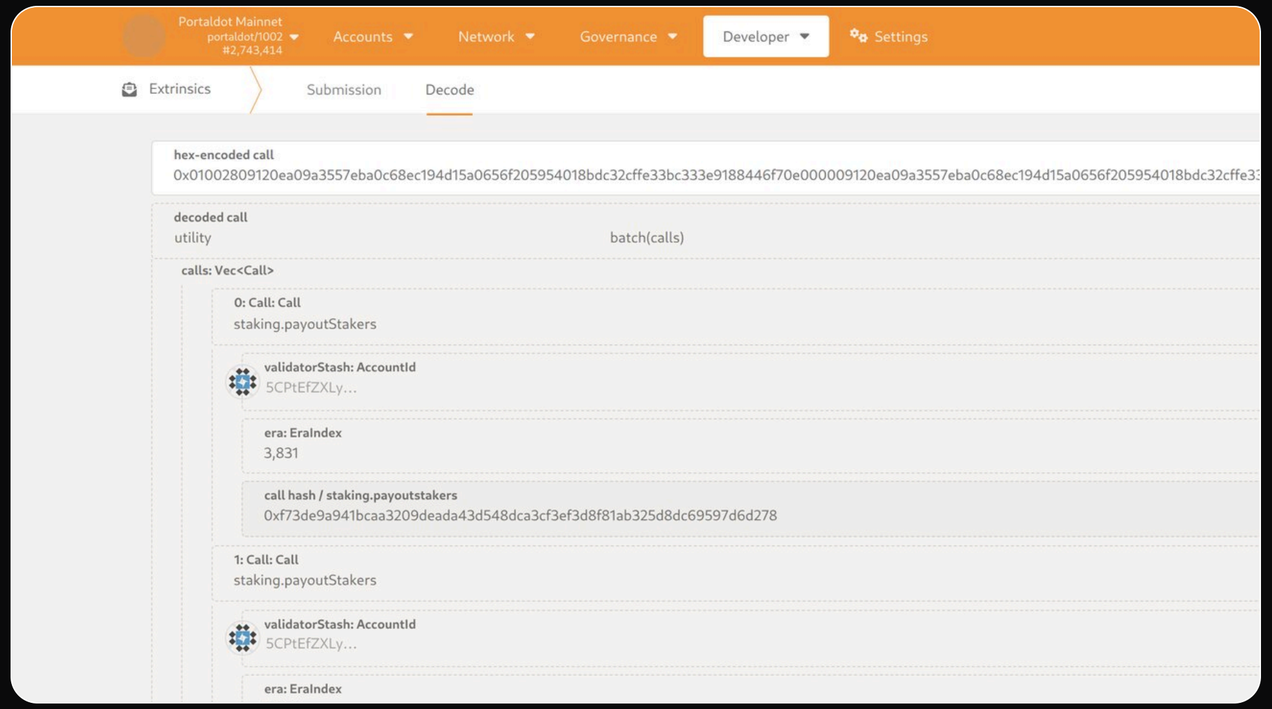

Node Console, block 204,115: payoutStakersByPage and its Rewarded events

Anyone can claim, with their own wallet.

PortalNode's account check: a mainnet validator with 84 unclaimed payouts

Node Console: a utility.batch of payoutStakers, oldest era first

WHY PORTALDOT IS ESSENTIAL

Built on what Portaldot runs, not around it.

`staking pallet`

`payoutStakersByPage` on V3 and `payoutStakers` on mainnet runtime 1002, chosen from the runtime's shape

`pallet-revive (V3 EVM)`

the ValidatorHealth contract, written each era by the keeper's own sr25519 key through `revive.call`

`pallet-im-online + session`

liveness exactly as the chain counts it, warnings before a validator is reported offline, key checks

`Node Console`

every user-signed action (claims, the setup batch) opens in Portaldot's own console; no custom wallet

The gap exists because of how Portaldot pays: rewards are pulled by a payout transaction and expire after 84 eras. PortalNode closes that gap for every validator and nominator, on both networks.

EVIDENCE · ALL CHECKABLE ON CHAIN

Running unattended since 18 October.

Payouts claimed on V3	**126** (eras 1–63, both validators), **217.46** **tPOT**, each about a minute after its era closed
Receipts	every one re-verified live against its finalized block: `portalnode.timidan.xyz/api/receipts`
ValidatorHealth contract	`0x072a1022f537a0da49680123972553910 1a41bb2`, reported every era since era 50; source recompiles byte for byte
Keeper account	`5HCFicFwm7GoC8R4swpr2WTFFvkH1WkzJQdVcsq6jMFDQVk3` (pays fees only)
Mainnet, read-only	140,040 POT unclaimed; 4 of 10 validators unpaid; 93.7% of stake on one validator
Code	MIT, `github.com/Timidan/portalnode`; tests pass on a fresh clone

A keeper the network can rely on.

Who it serves

- Validators and nominators: rewards stop expiring unclaimed.
- Operators: payouts, liveness, keys and alerts in one service next to their node.
- dApps: validator health readable on-chain or from a public status API.

Next, with ecosystem support (planned)

- Turn on keeper signing on mainnet, agreed with the community.
- Package the V3 node the day its binary is published.
- A hosted keeper for validators who run no infrastructure.
